

CSE 532 Assignment #2

Group Members:

1. Jatin Garg (111462753)
2. Rahul Bhansali (111401451)

Questions 1.) (30 points) Let us consider the following relations/predicates:

- Courses(number, quarter, instructor)
- Prereqs(course, prerequisite)
- Students(id, name, address)
- Enrolls(studentID, course, quarter, grade)

Note that courses are represented by their unique numbers in relations Prereqs and Enrolls; students are represented by their ID's. Prereqs table contains only direct prerequisite. For example, if CS101 is a prerequisite of CS200, and CS200 is a prerequisite of CS342, then only the pairs (CS200, CS101) and (CS342, CS200) would appear in Prereqs. We refer to CS101 as an indirect prerequisite of CS342. A prerequisite is considered satisfied only if the students gets an A or A- grade in the course.

1. Write a datalog program that finds all (student, course, quarter) triplets (x,y,q) such that x enrolls in y in quarter q but did not satisfy (i.e., didn't enrol or enrolled but got a B+ or lower grade) one or more of y's direct/indirect prerequisites in a **prior** quarter. In other words, you are trying to create a table of "violations"; a triplet is a violation if either a direct or an indirect prerequisite of a course has not been satisfied in a prior quarter. See #4 below for an example.

Logic:

1. We find all pairs (A,B) such that B is a prerequisite for A (direct or indirect).
2. We find the complement of the Enrolls table i.e. all pairs (S, C) such that a student S is not enrolled for course C.
3. We find all violation tuples, and it can arise from either of these conditions:
 - a. Student got a grade lesser than 'A-' (i.e. B+ or below) in the course.
 - b. Student is enrolled in a prerequisite course for the course after the course's quarter.
 - c. Student didn't enroll for a prerequisite for the course.

Datalog Program:

1. $\text{AllPrereq}(c, p) \leftarrow \text{Prereqs}(c, p)$
2. $\text{AllPrereq}(c, p) \leftarrow \text{AllPrereq}(c, x), \text{Prereqs}(x, p), c \neq p$
3. $\text{Grade}(g) \leftarrow \text{Enrolls}(s, c, q, g)$
4. $\text{NotEnrolls}(s, p) \leftarrow \text{NOT Enrolls}(s, p, q, g), \text{Courses}(p, q, \text{instructor}), \text{Students}(s, \text{name}, \text{address}), \text{Grade}(g)$
5. $\text{NotSatisfy}(s, c, q) \leftarrow \text{AllPrereq}(c, p), \text{Enrolls}(s, c, q, g), \text{Enrolls}(s, p, q', g'), g' \leq 'B+', c \neq p$
6. $\text{NotSatisfy}(s, c, q) \leftarrow \text{AllPrereq}(c, p), \text{Enrolls}(s, c, q, g), \text{Enrolls}(s, p, q', g'), q' \geq q, c \neq p$
7. $\text{NotSatisfy}(s, c, q) \leftarrow \text{AllPrereq}(c, p), \text{Enrolls}(s, c, q, g), \text{NotEnrolls}(s, p), c \neq p$
8. $\text{Answer}(\text{name}, c, q) \leftarrow \text{Students}(s, \text{name}, \text{address}), \text{NotSatisfy}(s, c, q)$

Question 2) (40 points) Consider a database for the Paris Metro and Bus lines, consisting of two relations *Metro*(*Station*, *Next*) and *Bus*(*Station*, *Next*). Write the following questions in Datalog:

1. Find pairs of stations (*m,n*), such that *m* can be reached from *n* by a bus path (using only buses) AND a metro path (using only metros).
 - $\text{BusPath}(a,b) \leftarrow \text{Bus}(a,b)$
 - $\text{BusPath}(a,b) \leftarrow \text{BusPath}(a,c) , \text{Bus}(c,b)$
 - $\text{Metro}(a,b) \leftarrow \text{Metro}(a,b)$
 - $\text{MetroPath}(a,b) \leftarrow \text{MetroPath}(a,c) , \text{Metro}(c,b)$
 - $\text{Answer}(m,n) \leftarrow \text{BusPath}(n,m) , \text{MetroPath}(n,m)$

2. We say that the metro is useless in a bus path from *m* to *n* if by taking the metro at any intermediate point *k* one can return to *k*, but not reach any other (intermediate) station along the path. Find the pair of stations (*m,n*) such that the metro is useless in all the bus paths connecting *m* and *n*.

$\text{BusPath}(a,b) \leftarrow \text{Bus}(a,b)$
 $\text{BusPath}(a,b) \leftarrow \text{BusPath}(a,c) , \text{Bus}(c,b)$

$\text{Metro}(a,b) \leftarrow \text{Metro}(a,b)$
 $\text{MetroPath}(a,b) \leftarrow \text{MetroPath}(a,c) , \text{Metro}(c,b)$

$\text{NotAnswer}(a,b) \leftarrow \text{BusPath}(a,c1) , \text{BusPath}(c1,c2) , \text{BusPath}(c2,b) , \text{BusPath}(a,b) ,$
 $\text{MetroPath}(c1 , c2) , c1 \neq c2 , c1 \neq a , c1 \neq b , c2 \neq a , c2 \neq b , a \neq b$

$\text{Answer}(a,b) \leftarrow \text{NOT } \text{NotAnswer}(a,b) , \text{BusPath}(a,b)$

Question 3.) (30 points) Suppose we have EDB relations: *frequents*(*Drinker*, *Bar*) , *serves*(*Bar*, *Beer*), and *likes*(*Drinker*, *Beer*). The relations have obvious meanings. Define the following predicates using safe datalog rules.

1. *veryHappy*(*D*) if every bar that drinker *D* frequents serves at least one beer he likes. You may assume that every drinker frequents at least one bar.
2. *sad*(*D*) if drinker *D* frequents all bars that serve no beer he likes.

1.) First we calculated all bars which the user frequents and that bar sells at least 1 beer that the drinker likes. After that a drinker is called sad when he frequents a bar that is not in Satisfy(). After taking negation of sad drinkers, we get our happy drinkers.

- $\text{Satisfy}(D, Ba) \leftarrow \text{serves}(Ba, Be) , \text{likes}(D, Be)$
- $\text{Sad}(D) \leftarrow \text{frequents}(D, Ba) , \text{NOT Satisfy}(D, Ba)$
- $\text{Drinker}(D) \leftarrow \text{frequents}(D, Ba)$
- $\text{veryHappy}(D) \leftarrow \text{NOT Sad}(D), \text{Drinker}(D)$

2.) First, we are finding LikesBar(*D*,*Ba*) that sells atleast 1 beer that the user likes. After that we calculated NotLikesBar(*D*, *Ba*), which does not sells any beer that the user likes. After that we calculated bars that the user does not frequents. Now if the user does not frequent at least 1 bar that the user likes, he is called as happy. We took the negation of that to find the sad drinkers.

- $\text{LikesBar}(D, Ba) \leftarrow \text{serves}(Ba, Be) , \text{likes}(D, Be)$
- $\text{Drinker}(D) \leftarrow \text{frequents}(D, Ba)$
- $\text{Bars}(Ba) \leftarrow \text{serves}(Ba, Be)$
- $\text{NotLikesBar}(D, Ba) \leftarrow \text{NOT LikesBar}(D, Ba), \text{Drinker}(D), \text{Bars}(Ba)$
- $\text{NFrequents}(D, Ba) \leftarrow \text{NOT frequents}(D, Ba), \text{Drinker}(D), \text{Bars}(Ba)$
- $\text{Happy}(D) \leftarrow \text{NotLikesBar}(D, Ba), \text{NFrequents}(D, Ba)$
- $\text{sad}(D) \leftarrow \text{Drinker}(D), \text{NOT Happy}(D)$
